

Investment Principles

Introduction to investing

The world of investing can seem a bit daunting, particularly if you're new to it.

This pack is designed to demystify some of the basics surrounding investing and give you some insight into how it works. We'll talk you through your options and our four investment principles to help you make more of your money without taking any more risk than you're comfortable with.

For more information please visit our adviser support page www.omnisinvestments.com/adviser-support-page

Contents

The pack is split into four sections:

1 Setting investment goals

2 Types of investment

- Cash
- Bonds
- Equities
- Alternatives (inc. property)
- Collective investments

3 Investment principles

- Attitude to risk
- Diversification
- Time in the market
- People, process and governance

1. Setting investment goals

Setting investment goals

When creating a portfolio it is crucial to understand the amount of risk you are willing to take, and your investment objectives over the short, medium and long term, as this will determine the best type of asset mix, and ultimately the potential investment rewards they can expect to generate.

Time horizon is also important – if you are saving for retirement for example, the closer you get to your goal the less risk you are likely to want to be exposed to! You don't want your lump-sum fluctuating wildly just before retirement.

These pie charts show how the composition of a typical portfolio could change over the lifespan of an investment. But what do these pie charts mean, and how do we decide on the ingredients?

Over the following pages we will look at the important things to consider when deciding on a portfolio that's right for you.

2. Types of investment

Types of investment

Cash

What are your choices when looking to beat inflation and achieve your long-term objectives? Here we look at the main options available and highlight the potential benefits and pitfalls of each.

You can invest in almost anything, including the likes of fine wines and antiques. More traditionally however, there are four core areas of investment, or 'asset classes' as they are known.

Cash

Cash is the asset class with the least associated risk and is useful as part of a diversified portfolio as it offers security and easy access. There are many places you can hold cash, with banks and building societies offering cash savings accounts.

Whilst cash offers the benefit of easy access, it tends to provide lower long-term returns than other asset classes and its value can be eroded by inflation.

Types of investment

Bonds

Bonds are issued by companies or governments looking to raise cash. By investing in a bond you are in effect lending the issuer your money and hoping, in return, for a regular income and your capital back at a set date in the future. The characteristics of bonds mean they are a key portfolio component for more cautious minded investors.

Bonds tend to fluctuate in value less than equities and should repay your original investment at the end of a fixed term. However, the scope for your money to grow is usually limited in comparison to the growth achieved historically by equities, and there is the possibility that the issuer could default on the loan. Fluctuations in interest rates can also affect the value of a bond – generally when interest rates rise, bond prices fall and vice versa.

Although bonds are usually considered medium risk, this depends hugely on who is issuing them. Bonds issued by the UK Government are called Gilts and are considered very creditworthy, whilst the risk involved in corporate bonds is dependent on the business issuing them. The level of income a bond pays reflects the risk you are taking – a company with a higher risk of default will have to reward investors with a higher yield.

Types of investment

Equities (or shares)

Equities are probably the best known of the asset classes and are quite simply an ownership stake in an individual company listed on a stock market index, such as the FTSE 100 in the UK, the S&P 500 in the US or the Nikkei 225 in Japan.

People invest in shares in anticipation of an increase in their value, and/or the receipt of a regular income through dividend payments. Whilst history should not be considered a guide to the future, it does show that over the longer term equities tend to outperform other types of investment.

Of course, shares can be volatile, and their value can go up as well as down and you may not get back the full amount invested and the fortunes of different shares can vary dramatically.

Alternative investments

e.g. property

The scope of today's investment world is greater than ever before, and whatever the angle, there is usually a collective investment fund providing access to it (we'll look at collective investments on page 11). Private equity, hedge funds and property are just some of the 'alternative' asset classes which are now easier for private investors to access.

The family home is the most significant investment many of us will ever make, and one that given time is likely to net a tidy profit. Returns from property investments tend not to be closely correlated with those of shares or bonds. This makes it useful from a diversification perspective introducing another source of capital growth potential and income into your investment portfolio.

Although property tends to be less volatile than equities and bonds, its value can fall as well as rise. It is also less liquid than other assets, meaning that it takes longer to invest into, and also to access your money when you need it.

Of course, focusing purely on residential property ignores other opportunities including those offered by commercial property. Property investment funds have proven popular as they provide access to commercial property to those unable to own for example an office block or a shopping centre.

Infrastructure funds invest in large, high cost projects, often connected to government and other public bodies development of core systems of transportation, communications, electrical supply etc.

Natural resources investment is investing in the companies (either directly or through funds) that are involved in the extraction of oil, gas, coal, metals and other natural resources.

Funds

Investing in individual companies carries more risk and requires more knowledge to make the right choices, to monitor your investments and make changes as necessary. For these reasons, adopting a collective approach can be extremely beneficial when entering the world of investing.

Funds are offered by investment management companies and provide easy access to a range of asset classes.

When you invest in a fund, your money is added to that of many other investors which professional fund managers then invest according to the investment objective of the fund, in a number of different underlying investments to spread the risk.

Because your money is pooled with other investors, it means that even if you only have a small amount to invest, you can access a range of investments that otherwise you might not be able to.

3. Investment principles

Investment principles

In the previous section we focused on ways of accessing different asset classes. Now we look at some of the key things we strongly believe create a platform for successful long-term investing. We call these our investment principles.

Understanding your attitude to risk

When choosing how and where to invest, you need to establish a plan that reflects your investment goals, perspective on risk and the amount you are willing to invest. Establishing your attitude to risk is essential. How you feel about the prospect of placing money at risk and your ability to accommodate any potential loss in value is uniquely personal to you. An investment which seems full of exciting potential to one individual can seem too risky to another.

Whether you are investing for the short, medium or long term is also important, and will have an impact on how you view risk. With a longer time horizon you may be happy to accept more risk for greater potential returns to achieve your objectives, however, the closer you get to your goal the less risk you are likely to want to be exposed to, and your investment approach will need to be reviewed and adjusted accordingly.

Even the best laid plans can't be expected to cope with all that life throws at you, and there are likely to be times when one-off events prompt a reappraisal and adjustments to your finances. There may be scenarios such as an inheritance, where you now suddenly have more wealth to manage than before or a divorce where a change in your circumstances will often necessitate a complete financial review. Either way, you will have to reassess your tolerance and willingness to take risk, particularly in the context of your long-term planning or retirement.

It's not just future investment decisions that are likely to be affected, and you will probably find that any existing investments will need reviewing in terms of their suitability. Tweaking around the edges of your existing portfolio might not be sufficient and it makes sense, when things fundamentally change, to undertake a full financial health check – one that results in your finances being fully aligned to your new circumstances.

Diversification is key

Holding a range of different investments is one of the foundations for investment success. By not putting all your eggs in one basket you are limiting the impact of loss in any particular area and giving yourself the opportunity to generate investment performance from a range of different sources.

Get the balance right - getting the right blend between assets involves more than a random selection and requires a careful assessment of their respective characteristics, behaviours and interrelationships. Getting the balance right between different asset classes is key!

Some asset classes – like cash and bonds have more ‘defensive’ characteristics, whilst equities - which carry more risk - can offer greater growth potential for your portfolio. Ultimately, you should look to have ‘balance’, providing scope for out-performance, whatever the prevailing financial backdrop.

Diversified portfolios

Effective diversification means a higher expected return for a given level of expected risk. This is achieved by combining assets which can reasonably be expected to behave differently over time, as illustrated by the pink performance line below.

Past performance is not a guide to future performance and should not be relied on.

The value of investments and any income from them can fall as well as rise and you may not get back the original amount invested.

Chart is figurative only.

Why a diversified investment strategy is important?

Use the colour coding to see how the performance of various asset classes can vary from year to year.

It should not be the main or sole reason for making an investment decision.*

*The value of investments and any income from them can fall as well
as rise and you may not get back the original amount invested.*

The importance of dividends

Long-term performance

Reinvesting dividends is one of the most powerful tools available for boosting investment returns over time. Investors over the last 20 years would have seen a noticeable difference in the value of their investments by doing so.

The chart opposite shows how £1,000 invested in December 2004 would be valued based on the share price alone, compared with performance that takes into account dividend reinvestment, where the same £1000 investment would be worth double the amount.

Past performance is not a guide to future performance and should not be relied on.

The value of investments and any income from them can fall as well as rise and you may not get back the original amount invested.

Long-term performance

Equities vs cash

Despite well publicised market crashes, over time investing in equities has been proven to significantly out-perform leaving money as cash savings.

This chart compares the growth of £1,000 invested in global equities with leaving money in a cash deposit account over the past 30 years, as well as the impact of inflation. Despite a number of stock market crashes, equities have outperformed significantly over the long term.

Past performance is not a guide to future performance and should not be relied on.

The value of investments and any income from them can fall as well as rise and you may not get back the original amount invested.

This graph shows performance from 01/12/1994 to 01/12/2024

Time, not timing

Be in it for the long haul

We've looked at some of your investment options – their good & bad points and what they can offer your investment portfolio. For all their differences they do share one thing in common – it can take time for them to maximise their potential.

It's time, not timing, that really matters in the world of investment.

Although the timing of buying and selling investments can be important, over a longer period, short-term price movements should have less effect on your investment and it should have more time to grow.

The chart shows how an investment of £1,000 in the UK stock market would have grown into over £2,700 over the last 15 years. The progress isn't totally smooth however with markets suffering setbacks from time to time – the Covid-19 pandemic among the notable.

Past performance is not a reliable indicator of future performance and should not be relied upon.

Time, not timing (continued)

Staying invested

Although such episodes can be extreme (and painful) it makes sense to look beyond the here and now and focus instead on the timescale that really matters – the long-term one.

After each drop, equities have soon gone on to resume an upward trend and maintain their historic outperformance of other asset classes. However, it should be remembered that past performance is not a guide to future performance.

Can you time the market for success?

The fact that markets can experience sharp falls and periods of uncertainty means you should really be willing to invest for a minimum of five years. But what if it were possible to time your investments to harness the markets' ups and downs for your benefit – selling at the peaks and buying at the lows?

Indeed, the latter can have a huge effect – just look at the table to see how the average annual returns of some of the world's stock markets can be affected when you strip out some of the top.

Forecasting such events is nigh on impossible and bad news for those investing their cash just before a downturn. Fortunately, given time, financial markets have proven capable of shrugging off short-term falls – and whilst returns in some years are much higher or lower, the average annual gain made by the UK stock market is around 7%.

Average Annual Returns over 15 years - effect of missing best days...

Index	Stayed fully invested	Best 10 days missed	Best 20 days missed	Best 30 days missed
FTSE All-Share	7%	3.88%	1.79%	-0.10%
S&P 500	13.88%	9.36%	6.63%	4.46%
DAX 30	8.27%	4.08%	1.34%	-0.96%
CAC 40	7.78%	3.34%	0.50%	-1.89%
Hang Seng	3%	-1.12%	-3.86%	-6.33%

The table above reflects compound annual growth rates of select global indices over 15 years. It also includes, by comparison, compound growth rates if you were invested in each index over the best 10, 20 and 30 days missed. All returns based in sterling.

Source: Bloomberg as at 31/12/2024

Can you time it for success?

Average annual returns over 20 years – effect of missing best days...

The fact that markets can have sharp dips and periods of uncertainty means you should really be willing to invest for a minimum of five years. But what if it were possible to time your investments to harness the market's ups and downs for your benefit – selling at the peaks and buying at the lows? Indeed, the latter can have a huge effect – the chart below shows how the returns on £1,000 invested in some of the world's stock markets can be affected when you miss some of the top performing days. It's impossible, even for investment professionals, to time when to invest and when to disinvest as no one can know exactly when a peak or a dip in a market will occur. So having an investment portfolio that's well diversified across different asset classes and where you remain invested is a sound investment principle.

Past performance is not a guide to future performance and should not be relied on.

The value of investments and any income from them can fall as well as rise and you may not get back the original amount invested.

Omnis robust governance process – ensuring your portfolio stays on track

1. Omnis Investment Team

The Omnis Investment Team looks after your money and sits at the heart of our investment proposition.

2. Weekly Analyst Committee

The Analyst Committee meets weekly and is the Investment Team's chance to discuss the allocations to the various Omnis funds and market activity, as well as upcoming economic events.

3. Monthly Sector Reviews

A Monthly Sector Review puts each of the investment classes that we include in our portfolios under constant scrutiny.

4. Quarterly Asset Allocation Reviews

The Quarterly Asset Allocation Review looks at all the investment classes in detail to assess their long-term prospects, with these views then translated into fund selection for our portfolios.

5. Investment and Proposition Committee

The Investment and Proposition Committee meets at least monthly and is responsible for setting our asset allocation policy. It is also responsible for forming our list of recommended funds. Membership is made up of senior management from Openwork & Omnis, as well as independent insight from a global leading investment consultant.

6. Investment Performance and Risk Committee

The Investment Performance and Risk Committee is responsible for selecting and monitoring the managers of our Omnis range of funds.

7. Investment Mandate Structure

The Investment Mandate Structure is the strict set of parameters within which the Investment Team can operate to ensure you are not exposed to excess or unnecessary risk.

The value of investments and any income from them can fall as well as rise and you may not get back the original amount invested.

Drip your way to success

Pound cost averaging

One way you can limit your exposure to the impact of one-off events (and potentially profit from the opportunities they present) is to make smaller payments on a regular basis. Investing in such a way is not only more affordable but it helps smooth out the market's peaks and troughs although there's no guarantee of this.

In this example, the graph here demonstrates the benefits of adopting a regular savings approach, comparing the historic outcomes of investment in the stock market compared to a cash deposit account.

Whilst it should always be remembered that, **the value of your investment can go up as well as down and you may not get back the full amount invested**, the graph clearly illustrates the benefits of regular saving (drip feeding) in the stock market and doing so over the long term.

The value of £50 per quarter invested in an average balanced mixed asset investment fund v cash over 5, 10 and 15 years

Overcoming inflation

With inflation having the potential to erode the real value of your savings it makes sense to consider the other options that are available. In the meantime, a quick glance at perhaps the most obvious alternative – the stock market – highlights some of the potential those sticking with cash will be foregoing.

The chart on the right shows that a balanced mixed asset investment portfolio can deliver stronger returns over the long term, than cash, which can protect your investment further from the effects of inflation.

This higher potential isn't without its pitfalls and stock market investment involves a higher acceptance of risk and a realisation that **the value of your investment can go up as well as down and you may not get back the full amount invested**. And with the potential for short term fluctuations it is also necessary to invest with a longer-term timescale in mind. Over the long haul however, shares have proven to generate higher returns.

The value of £5000 invested in an average balanced mixed asset investment fund v cash over 5, 10 and 15 years

Your Openwork Partnership Adviser

Working in partnership with you, your adviser will gain a clear understanding of your current situation and future goals and establish your attitude to risk.

Taking these things into account, they will research an investment solution which they think is appropriate for you. Before proceeding, they'll discuss it in detail so that you understand and feel comfortable with it.

Your adviser will work with you to make sure you stay on track over the years ahead, and through regular catch ups you can discuss changes to your requirements or circumstances and review your investment choices.
